**3. (5 pts)** Adapt the Text\_Classification.ipynb notebook to build a classifier for the following tweet dataset. The dataset contains tweets pertaining to disasters and non-disasters. Print the classification report after splitting into a train and test dataset similarly to the mentioned notebook.

<https://raw.githubusercontent.com/nikjohn7/Disaster-Tweets-Kaggle/main/data/train.csv>

You should submit your notebook and a pdf printout.

**4. (6 pts)** Construct the root and the first level of a decision tree for the titanic dataset. Use entropy to decide splits. Show the details of your construction (entropies calculated for each step). You can use a spreadsheet to compute the counts.
